

1. The third element of an array has an index value of **2** because array indexes start at 0.
2. `int[ ] quantities = new int[20];`
3. `double[ ] heights = {1.65, 2.15, 4.95};`
4. `for (int grade : grades)`

```
{  
    System.out.println(grade);  
}
```

6. Passing an entire array to a method allows the method to work with all the elements in the array. Passing a single element only sends one value from the array.

7. Offset array indexes are required when the numbering system for the data does not begin at 0. They help match array positions to real-world numbering systems.

8. i.

10. A dynamic array is a better choice when the amount of data may change during the program, such as storing a list of students joining a club.

11. The `indexOf()` method uses the `equals()` method to compare the object passed to the method with elements in the `ArrayList`.

12. The values of wrapper class objects can be compared using the `.equals()` method.
